

Contents

1. Introduction	1
1.1. The model organism <i>Bacillus subtilis</i>	1
1.2. Phenotypes for environmental adaptation	2
1.3. The σ^B -induced general stress response	4
1.4. The truth of numbers	7
1.5. Aims and outline	9
2. Mathematical models for <i>B. subtilis</i>	11
2.1. Regulation of chemotaxis	11
2.2. The phosphorelay phenotype hub	13
2.3. Signalling mechanisms in sporulation	18
2.4. The consequences of excitability in competence	20
2.5. Production of extracytoplasmic proteases	22
2.6. Operon organisation of stress responses	23
2.7. Partner switching mechanism and general stress response	24
2.8. Conclusions	26
3. Stressosome simulation I: Monomer interactions	27
3.1. Known facts of stressosome activation	28
3.2. A geometric model of the stressosome	30
3.3. Normalisation of signal-response data	34
3.4. Experimental reproduction of stressosome simulations	35
3.5. Consequences of the assumptions and limits of prediction	39
3.6. Integration of the results to current knowledge	41
3.7. Conclusion	42
4. Stressosome simulation II: Shape transitions	45
4.1. Construction of geometric models for the stressosome	48

Contents

4.2. Structure and motions of icosahedra	52
4.3. Efficient stressosome activation via cooperation	54
4.4. Parameter scan for stressosome activation	55
4.5. A new review of events during stressosome activation	56
4.6. Relation of the results to experimental observations	60
4.7. Model predictions and tests	61
4.8. Conclusions	61
5. σ^B induced proteome reorganisation	63
5.1. Open questions in the general stress response	64
5.2. The reporter protein has transient activity in BSA115	65
5.3. Modelling of transient responses	66
5.4. Model setup and parameter estimation	67
5.5. Simulation and experiment cycles prove proteolysis	69
5.6. Proteolysis as part of transient wild-type responses	71
5.7. Implications of reporter protein instability	73
5.8. A wider context of transient responses	74
5.9. Conclusion	75
6. Final remarks	77
7. Bibliography	81
A. Simulations of RsbR-paralogue dynamics	i
B. Triangle collapse parameter scan	iii
C. Supporting information for σ^B protease expression	v
